# Solenoid valves 2/2-way servo operated type EV260B

EV260B is a proportional (modulating) servo-operated 2-way solenoid valve with connections from 1/4" to 3/4".

Through stepless regulation of the coil current, the armature can be placed in any position in the armature tube, thus setting the valve to any position between completely closed and completely open.

The valve is fully open when the coil current has reached its maximum value.

**Features and versions:**

- For water, oil and similar neutral liquids
- Linear characteristic throughout the regulation range
- Closes on power failure (fail-safe function)
- Flow range from 0.5 – 12.7 m<sup>3</sup>/h
- Differential pressure from 0.5 – 10 bar
- Media temperature from -10 – 80 °C
- Ambient temperature: Up to 50 °C
- Coil enclosure: Up to IP67
- Viscosity: Up to 50 cSt
- Thread connections: From G 1/4 – G 3/4
- DN 6 – 20
- Brass version NC
- Standard 4–20 mA or 0–10 V d.c. pilot signal
- Available with G and NPT thread.

Function

- 1. Coil
- 2. Closing spring
- 3. Armature
- 4. Pilot orifice
- 5. Diaphragm
- 6. Terminal box

Proportional regulation of the opening and closing of the EV260B valves is achieved through stepless regulation of the coil current and thus of the pulling force of the solenoid coil.

When the coil current is increased, the pulling force of the coil (1) will at a certain point exceed the counteracting spring force of the closing spring (2). The armature (3) moves up, opening the pilot orifice (4) in the diaphragm (5), which due to the servo effect follows the armature's movement.

The valve is fully open when the coil current has reached its maximum value.

Through stepless regulation of the coil current the armature can be placed in any position in the armature tube, and the valve thus set to any position between completely closed and completely open.

The effective coil current range for EV260B proportional valves without signal converter is approx. 300-600 mA.

The EV260B valves are also available with a signal converter built in the coil's terminal box (6). The signal converter's output terminals are connected to the solenoid coil.

The signal converter regulates the coil current so that it is proportional to the input signal (pilot signal).

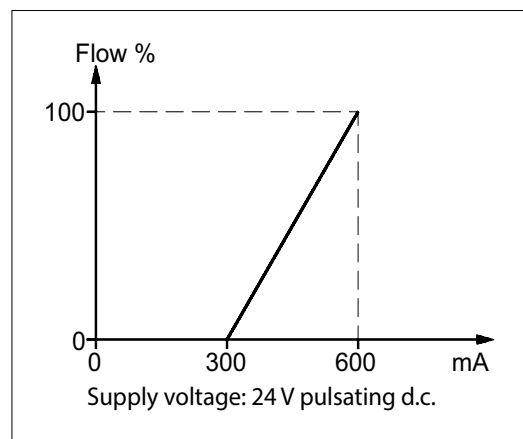

- The pilot signal may be a
- 0 - 10 V d.c. voltage signal
  - or a
  - 4 - 20 mA current signal

Signal flow characteristics

*Coil type BK*

*Without signal converter*

The basic version consists of a valve with a coil for pulsating direct current. The supply voltage of 24 V DC can be established with full-wave rectified alternating current. The valve begins to open at a coil current of approx. 300 mA and is fully open at a coil current of approx. 600 mA. The ratio between coil current and flow between the two outer points is directly proportional.

*Coil type BM*

*With signal converter and 0-10 V pilot signal*

The ratio between pilot signal and flow is directly proportional throughout the regulation range.

*Coil type BL*

*With signal converter and 4-20 mA pilot signal*

The ratio between pilot signal and flow is directly proportional throughout the regulation range.
